

Level limit measurement in fish food

The challenge

Our customer from Norway supplies complete feed stations, e.g. launch solutions for fish farms worldwide. He requested a simple but reliable level control in his share breeding pools. Thus, he can monitor and control the feeding in the pools with preventing the emptying of any pool.

Our solution

The UMF rotating paddle sensor ROTONEO HX200 is the perfect solution for the application. Especially the fibre-glass reinforced housing made from plastic is absolutely insensitive to the rough conditions near the sea. The high-quality sealing and bearing allow the reliable measurement even in salt.
