

Rotativo – limit switch in salt

The Challenge

Our customer is the largest producer of vacuum evaporated dietary salt in CE (the Commonwealth of Independent States) and Western Europe. The main line of company's activity is mining and production of white evaporated dietary table salt.

For the monitoring and control of the filling, a simple but reliable level monitoring for the process tanks with salt NaCl was needed.

Our Solution

The rotating paddle series ROTORNO PNO004 series is the perfect solution for this requirement. Thanks to Teflon coating it delivers reliable measurements of aggressive and very abrasive materials like NaCl.

The screw conveyor drive is designed to feed the material into the high-pressure grinding roller. To ensure a constant pressure load two ROTORNO PNO004 level sensors are installed which monitor material in the cassette. The output signals are integrated in the control. The sensors control the max and min level of the material.
