

Our robot

After creating the new `Robot` object, we then give it the `Robot` object as a parameter to the `run` method. This will then start the robot and the robot will try to find the robot's position by using the `findRobot` method to get the robot's position.

Robot

Our robot

Run: Run the Robot class

Run the robot class

- Robot has a long thin antenna
- Robot has a long thin antenna
- Robot has a long thin antenna
- It has a long thin antenna
