

Level limit measurement in Rotopacker

The challenge

A manufacturer of building materials, who operates throughout Germany, required an indicator for the Rotopacker. The device Rotopackit permanently fills bags (e.g. cement). Therefore a high reliability of the level switch was mandatory. Furthermore product changes were not supposed to affect measurement.

Our solution

With the IAS7 level limit sensor of the capacitive series (P2102) this application could be solved in an elegant way. Due to the high quality capacitive sensor, secure filling is guaranteed. The fast setting via "push button" calibration is very easy to accomplish. A product change does not affect relative setting.
