

Level limit measurement in Rotopacker

The challenge

A manufacturer of building materials, who operates throughout Germany required an indicator for his Rotopacker. This device (Rotopack) permanently filled bags (e.g. cement). Therefore a high reliability at the level switch was mandatory. Furthermore product changes were not supposed to affect measurement.

Our solution

With the UWT level limit sensor of the capacitive series RF3100 this application could be solved in an excellent way. Due to the high quality capacitive sensor, secure filling is guaranteed. The first setting via "push button" calibration is very easy to accomplish. A product change does not affect reliable switching.
