

As a result of the measurement in direction 1 the measured force will be the bending moment.

the sensor

The force will now be measured in the support of the shaft (1) and will also be measured in the other direction (2) with the force applied in the support of the shaft (2) in the direction of the shaft's bending and rotation. The force is an indicator of the bending moment and the way to determine the force will be the same as the force applied and the force applied will be measured in the same way.
